Governing Agentic AI in the Public Sector (A Framework for Extending Existing Governance)

Ramki Krishnamurthy | Data & Analytics Offering Lead

The Governance Gap (The “Why”)

- **Traditional AI Predicts:** Built for static, predictable systems tested within clear boundaries.
- **Agentic AI Acts:** Operates with autonomy and adaptation, often outside the assumptions of conventional frameworks.
- **The Risk:** When these systems learn and execute continuously, the scale of impact outpaces manual human oversight.

The Phased Roadmap (The "How")

- **Phase 1: Proof of Concept (PoC):** Validate technical feasibility in an isolated sandbox with zero public impact.
- **Phase 2: Experimentation:** Test behavior in realistic settings using real-world data while retaining human oversight.
- **Phase 3: Production:** Deploy full capabilities at scale with real-time controls, "kill switches," and continuous monitoring.

Public Sector Integrity

- **Strategic Alignment:** Our framework aligns with **OMB policy**, **NIST AI RMF**, and **OSTP guidance**.
- **Critical Guardrails:** Focuses on transparency in public decision-making and protecting citizen rights in real-time.
- **Modernization:** Shift from rigid, role-based controls to context-aware, risk-tiered autonomy.
